PCM4201EVM User's Guide

This document provides the information needed to set up and operate the PCM4201EVM evaluation module (EVM). For a more detailed description of the PCM4201, please refer to the product datasheet available from the Texas Instruments web site at www.ti.com. Additional support documents are listed in the section of this guide entitled ***Related Documentation from Texas Instruments*** and ***Additional Documentation***. Throughout this document, the acronym **EVM** and the phrase **evaluation module** are synonymous with the PCM4201EVM. This user s guide includes setup and configuration instructions, information regarding absolute operating conditions, an electrical schematic, PCB layout drawings, and a bill of materials (BOM) for the EVM.

1 Introduction

The PCM4201 is a low power, high-performance, single channel audio analog-to-digital (A/D) converter designed for use in battery-operated or portable professional audio applications, including digital wireless microphones and digital audio recorders/processors. The PCM4201 features a 24-bit linear PCM data output, with a data format compatible with digital signal processors and digital audio interface transmitters (including the DIT4096 and DIT4192 from Texas Instruments).

The PCM4201 includes three sampling modes, supporting sampling rates up to 108kHz. The Normal Speed Low Power mode supports sampling rates up to 54kHz, and employs 64x oversampling to reduce overall converter power. The Normal Speed High Performance mode supports sampling rates up to 54kHz with 128x oversampling, resulting in higher dynamic range than the Low Power mode, at the expense of increased power dissipation. The Double Speed mode supports sampling frequencies up to 108kHz, and is provided for those cases where higher sampling rates may be required.

A digital high-pass filter is included for DC removal. Dedicated control pins are included for sampling mode selection, Slave/Master mode port operation, digital high-pass filter enable/disable, and reset/power-down functions.

A +5V power supply is required for the analog section of the device, while a +3.3V power supply is typically utilized for the digital circuitry. The digital supply may operate at voltages as low as +1.8V, with a corresponding 10mW to 20mW reduction in power dissipation, depending upon the sampling mode selection. Figure 1 illustrates the functional block diagram for the PCM4201.

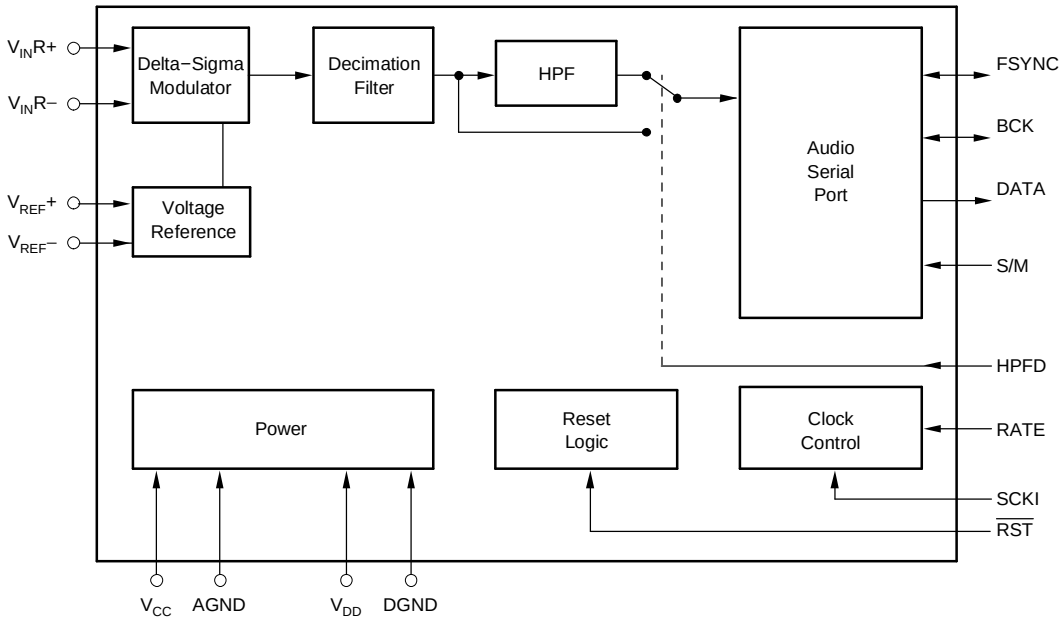

Figure 1. PCM4201 Functional Block Diagram

1.1 PCM4201EVM Features

The PCM4201EVM provides a convenient platform for evaluating the performance and functions of the PCM4201 device. The primary EVM features include:

- Simple configuration using an onboard DIP switch
- Differential voltage input supporting 3-pin XLR or balanced TRS connections
- Differential input buffer and filter circuit utilizing the Texas Instruments OPA2134 dual op amp
- Flexible input buffer power supply connection (dual or single supply options) and resistor/capacitor configuration allow for circuit experimentation and op amp substitution

- Buffered audio serial port output supports connection to external DSP hardware or audio test equipment
- An onboard Texas Instruments DIT4096 provides an AES3-encoded digital output suitable for use with audio test systems or commercial audio equipment, supporting output sampling rates up to 108kHz
- Onboard crystal oscillators, operating at 22.5792MHz and 24.576MHz, support 44.1kHz, 48kHz, 88.2kHz, and 96kHz sampling rates and all three sampling modes of the PCM4201
- An external clock input allows operation at alternative sampling frequencies

As shipped, the PCM4201EVM requires +15V, –15V, and +5V analog power supplies. Options are provided to operate the analog section from a single power supply by utilizing alternative op amps for the input buffer circuit. A +5V digital supply is required, with a +3.3V digital supply being derived onboard using a Texas Instruments REG1117 voltage regulator IC. Connections are provided for an external digital supply for the PCM4201, allowing digital operation down to +1.8V.

1.2 PCM4201EVM General Description and Functional Block Diagram

The PCM4201EVM provides a complete platform for evaluating the performance and features of the PCM4201 single channel audio A/D converter. Figure 2 illustrates the functional block diagram for the evaluation module.

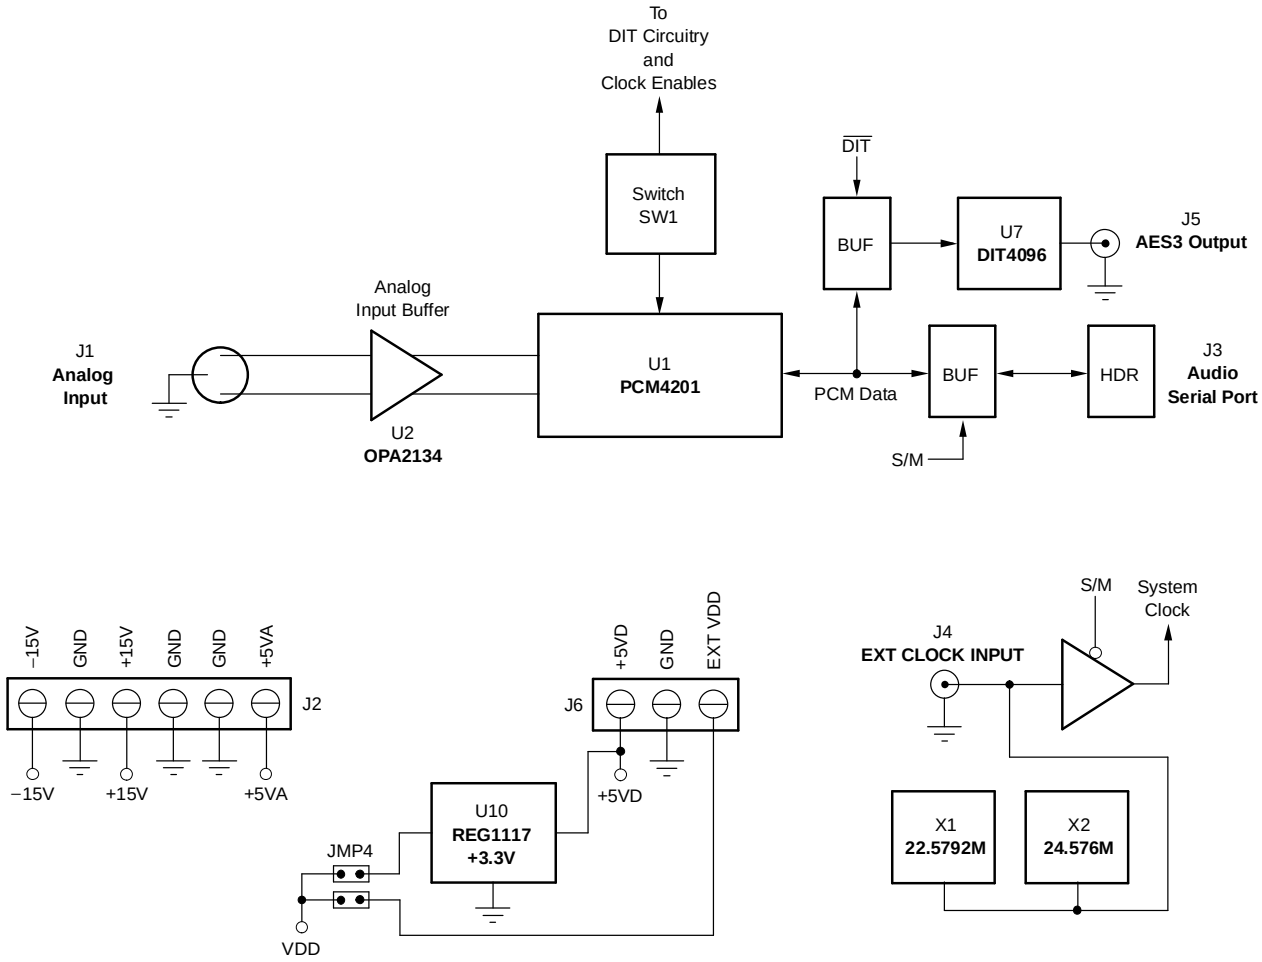

Figure 2. PCM4201EVM Functional Block Diagram

A differential analog input is supported at connector J1. The analog input supports either a 3-pin male XLR or balanced TRS input plug. The analog input is buffered and filtered using a low noise input circuit, utilizing a Texas Instruments' OPA2134 dual audio op amp IC. The output of the buffer circuit is connected to the differential input of the PCM4201, which is then used to convert the analog signal to a 24-bit linear PCM representation in the digital domain.

The 24-bit PCM output data is made available at header J3. The audio data can also be routed to the DIT4096 digital interface transmitter, supporting an AES3-encoded output, which is provided at BNC connector J5. The buffered header is convenient for interfacing to external development hardware or digital signal processors, while the AES3-encoded outputs may be connected to audio test systems or commercial audio equipment.

Power is connected to the board at either terminal block J2 for the analog supplies, or at terminal block J6 for the digital supplies.

Manual reset circuits are provided for both the PCM4201 (U1) and the DIT4096 (U7). The ADC RESET switch (SW2) is utilized for resetting the A/D converter, while the DIT RESET switch (SW3) is utilized for resetting the AES3 transmitter.

The system or master clock for the evaluation module may be generated onboard or by an external clock source. Oscillators X1 and X2 operate at fixed clock frequencies of 22.5792MHz and 24.576MHz, respectively. The oscillators provide low jitter clock sources for measuring the performance of the PCM4201 in Master mode operation. Alternatively, an external clock source may be connected at J4 for Master mode operation, supporting alternative sampling rates. For Slave mode operation, the system clock is provided from an external source through header J3. Switch SW1 provides configuration control for the PCM4201, the DIT4096, the onboard oscillators, and the external clock input at connector J4.

1.3 Related Documentation from Texas Instruments

The following documents provide information regarding Texas Instruments integrated circuits used in the assembly of the PCM4201EVM. The latest revisions of these documents are available from the TI web site at www.ti.com.

Data Sheet	Literature Number
PCM4201 Datasheet	SBAS342
DIT4096 Datasheet	SBOS225
OPA2134 Datasheet	SBOS058
REG1117 Datasheet	SBVS001
SN74ALVC245 Datasheet	SCES271
SN74LVC1G04 Datasheet	SCES214
SN74LVC1G08 Datasheet	SCES217
SN74LVC1G125 Datasheet	SCES223

1.4 Additional Documentation

The following documents or references provide information regarding selected non-TI components used in the assembly of the PCM4201EVM. These documents are available from the corresponding manufacturer.

2 Getting Started

This section provides information regarding handling, package contents, and absolute operating conditions for the PCM4201EVM.

2.1 Electrostatic Discharge Warning

CAUTION
Failure to observe proper ESD handling precautions may result in damage to EVM components.

Many of the components used in the assembly of the PCM4201EVM are susceptible to damage by electrostatic discharge (ESD). Customers are advised to observe proper ESD handling procedure when unpacking and handling the PCM4201EVM. All handling should be performed at an approved ESD workstation or test bench, using a grounded wrist strap. Failure to observe proper handling procedure may result in damage to the EVM and/or the module components.

2.2 EVM Package Contents

Upon opening the PCM4201EVM package, please check to make sure that these items are included:

- One PCM4201EVM evaluation module
- One printed copy of the PCM4201 product datasheet
- One printed copy of this PCM4201EVM User's Guide

If any of these items are missing, please contact the TI Product Information Center in your region.

2.3 Absolute Operating Conditions

CAUTION
Exceeding the absolute operating conditions may result in damage to the evaluation module and/or the equipment connected to it.

The user should be aware of the absolute operating conditions for the PCM4201EVM. Table 1 summarizes the critical data points.

Table 1. Absolute Operating Conditions

	Min	Max	Units
Power Supplies			
+15V	+5.0	+18.0	V
-15V	-5.0	-18.0	V
+5VA	+4.5	+5.5	V
+5VD	+4.5	+5.5	V
EXT VDD	+1.8	+3.6	V
Audio Serial Port (J3)			
V_{IH}, Input High Voltage	0.7 x V_{DD}	+3.6	V
V_{IL}, Input Low Voltage	-0.3	0.3 x V_{DD}	V
External Clock Input (J4)			
V_{IH}, Input High Voltage	0.7 x V_{DD}	+3.6	V
V_{IL}, Input Low Voltage	-0.3	0.3 x V_{DD}	V
Analog Inputs (J1)			
Input Voltage, Differential	0	18.5	V_{PP}

3 Hardware Description and Configuration

This section provides hardware description and configuration information for the PCM4201EVM.

3.1 Power Supply Configuration

The PCM4201EVM requires three analog power supplies and one digital power supply for operation. The analog supplies are connected at terminal block J2, while the digital supply is connected at terminal block J6.

Analog supplies include +15V and –15V DC for powering the input buffer circuit, as well as +5.0V DC for powering the analog section of the PCM4201. All supplies should be rated for at least 500mA of output current.

The digital supply requires +5.0V DC and should be rated for at least 500mA of output current. The +5.0V supply is regulated to +3.3V DC by an onboard Texas Instruments REG1117 linear voltage regulator (U10), which is used to power the digital section of the PCM4201 and the majority of the support logic circuitry. The core logic and line driver sections of the AES3 transmitter (U7) utilize the +5.0V digital supply directly.

An optional external VDD power supply is supported at terminal block J6. Jumper JMP4 is utilized to select either the onboard +3.3V voltage regulator (U10) or an external power source. Shorting pins 1 and 2 together using the supplied jumper block selects the onboard +3.3V voltage regulator. Shorting pins 3 and 4 together will select the external supply (EXT VDD) on terminal block J6. Only one source may be selected at any time.

The External VDD may be operated as low as +1.8V. However, the DIT4096 transmitter will only operate at voltages down to +2.0V. Use the audio serial port interface at header J3 when operating VDD at voltages lower than +2.0V.

3.2 Analog Input

The PCM4201EVM includes a Neutrik combo XLR connector (J1), which accepts either a 3-pin male XLR or a 1/4-inch TRS phono plug. The analog input can accept up to a $18.5V_{PP}$ differential input signal. This signal is then attenuated by a factor of 3.7 by the input buffer circuit, which corresponds to the $5.0V_{PP}$ full scale differential input voltage for the PCM4201 analog input.

The input buffer circuit is comprised of an OPA2134 dual audio operational amplifier and associated passive components. The input buffer provides active attenuation and low-pass filtering for the analog input signal. The OPA2134 is biased to approximately +2.5V, with the bias voltage being derived from the +5V analog supply using a voltage divider.

The input buffer circuit may be configured to accept either dual or single supply op amps. Jumper JMP2 allows the –15V supply to be shorted to ground. The +15V may then be adjusted to the appropriate single supply voltage for the op amp. When using a single supply op amp, it may be necessary to change the values of the buffer feedback and input resistors in order to adjust the gain or attenuation to match the maximum input/output voltage swing allowed by the single supply configuration.

3.3 System Clock Configuration

The OSC1 and OSC2 elements of switch SW1 are utilized to select the system clock source for the PCM4201EVM. Table 2 summarizes the available options. The onboard oscillators support 44.1kHz, 48kHz, 88.2kHz, and 96kHz sampling rates for Master mode audio serial port operation. Alternatively, the external clock input (J4) may be used to supply the system clock from an external source, supporting additional sampling rates.

For Slave mode operation, the system clock is input at the SCKI pin of the audio serial port header (J3).

Table 2. System Clock Source Selection

OSC2	OSC1	SYSTEM CLOCK SOURCE
LO	HI	X1, 22.5792MHz
HI	LO	X2, 24.576MHz
LO	LO	External Clock from connector J3 or J4

3.4 Sampling Mode Selection

The PCM4201 supports three sampling modes, allowing the user to select the best power/performance combination for a given application.

The Normal Speed Low Power mode provides the lowest overall power dissipation while supporting sampling rates up to 54kHz. The modulator oversampling rate is $64f_S$ for this mode.

The Normal Speed High Performance mode provides the best dynamic performance at the expense of increased power dissipation. Sampling rates up to 54kHz are supported. The modulator oversampling rate is $128f_S$ for this mode, improving the overall dynamic range and THD+N when compared to the Low Power mode.

The Double Speed mode supports sampling frequencies up to 108kHz with power dissipation just slightly higher than the Normal Speed High Performance mode. The modulator oversampling rate is $64f_S$ for this mode.

The sampling mode is selected using the RATE VDD and RATE GND elements of switch SW1. Table 3 shows the settings required for each sampling mode.

Table 3. Sampling Mode Selection

RATE VDD	RATE GND	SAMPLING MODE
OFF	ON	Double Speed
ON	OFF	Normal Speed Low Power
OFF	OFF	Normal Speed High Performance

3.5 Digital High-Pass Filter

The PCM201 includes a digital high-pass filter, which is utilized to remove the DC component from the digitized signal. The high-pass filter is located at the output of the digital decimation filter in the overall A/D signal chain. The –3dB corner frequency of the high-pass filter is set by the following relationship:

$$F_{-3dB} = \frac{f_S}{48,000}, \text{ where } f_S = \text{ output sampling rate}$$

The digital high-pass filter may be enabled or disabled using the HPFD element of switch SW1. Table 4 summarizes the HPFD switch settings. There may be a small increase distortion for low frequency inputs (less than 100Hz) when the high-pass filter is enabled.

Table 4. Digital High-Pass Filter Configuration

HPFD	HIGH-PASS FILTER FUNCTION
LO	Enabled
HI	Disabled

3.6 Audio Serial Port Interface

The PCM4201EVM audio serial port is accessed at header J3. The port includes the audio bit clock (BCK), the audio frame synchronization clock (FSYNC), and the serial audio data (DATA). The system clock (SCKI) is also available at the audio serial port. The audio serial port may be operated in Slave or Master Mode.

In Slave Mode, the BCK, FSYNC, and SCKI clocks are inputs to the PCM4201EVM, and may be provided from an external source (DSP, FPGA, etc.) via header J3. The BCK and FSYNC clocks must be synchronous with one another and the audio data.

In Master Mode, the BCK, FSYNC, and SCKI clocks are outputs, being derived by the PCM4201 using the on-board crystal oscillators or external clock source applied at connector J4.

The Slave or Master Mode port configuration is programmed using the S/M element of switch SW1. Table 5 summarizes the available settings.

Table 5. Slave/Master Mode Configuration

S/M	AUDIO SERIAL PORT SLAVE/MASTER MODE
LO	Master
HI	Slave

Slave or Master Mode audio serial port operation also dictates the required rate of the system clock (SCKI) supported for various sampling modes. A summary of the supported rates is shown in Table 6 and Table 7.

Table 6. System Clock Rates for Master Mode Operation

SCKI RATE	SAMPLING MODE WITH MASTER MODE AUDIO SERIAL PORT
$512f_S$	Normal Speed Low Power
$512f_S$	Normal Speed High Performance
$256f_S$	Double Speed

Table 7. System Clock Rates for Slave Mode Operation

SCKI RATE	SAMPLING MODE WITH SLAVE MODE AUDIO SERIAL PORT
$256f_S$ or $512f_S$	Normal Speed Low Power
$256f_S$ or $512f_S$	Normal Speed High Performance
$256f_S$	Double Speed

3.7 Digital Interface Transmitter

A Texas Instruments DIT4096 digital interface transmitter provides an AES3-encoded output for the PCM4201EVM. The $\overline{\text{DIT}}$ and DITCLK elements of switch SW1 are utilized to configure the transmitter. The output of the transmitter is available at connector J5. This output is designed for use with 75Ω coaxial cable connections.

The transmitter is enabled using the $\overline{\text{DIT}}$ element of switch SW1. The $\overline{\text{DIT}}$ switch operation is summarized in Table 8.

Table 8. Digital Interface Transmitter Configuration

$\overline{DIT}$	DIGITAL INTERFACE TRANSMITTER
LO	Enabled
HI	Disabled

The audio data format for the transmitters is hardwired for 24-bit Left Justified data format. Only one channel (Channel A of the AES3 stream) will carry 24-bit linear PCM audio data.

Like the PCM4201, the DIT4096 transmitters must be configured for the proper Master (or System) clock frequency. The transmitter master clock is driven by the same source as the PCM4201 system clock, as described in Section 3.3 of this document. The transmitter master clock rate selection must match the system clock rate selection for the PCM4201. Table 9 summarizes the master clock rate options for the DIT4096 transmitter using the DITCLK element of switch SW1.

Table 9. Transmitter Master Clock Configuration

DITCLK	TRANSMITTER MASTER CLOCK RATE
LO	$256f_S$
HI	$512f_S$

3.8 Reset Operations

The PCM4201EVM includes two reset switches, SW2 and SW3. Both are momentary contact, normally open pushbutton switches. Switch SW2 provides the manual reset for the PCM4201, while switch SW3 provides the manual reset the DIT4096 digital interface transmitter.

The PCM4201 may be reset at any time by momentarily pressing and then releasing switch SW2. This generates a reset pulse and initiates a reset sequence for the device.

For the transmitter reset function, the output of the reset circuit is connected to the $\overline{RST}$ pin of the DIT4096 transmitter. The DIT4096 may be reset only when the $\overline{DIT}$ switch of SW1 is set LO by momentarily pressing and then releasing switch SW3. If the $\overline{DIT}$ switch is set HI, the output of the AND gate in the reset circuit is forced low, which will force the transmitter into power down mode. The transmitter reset circuit is shown in Figure 3.

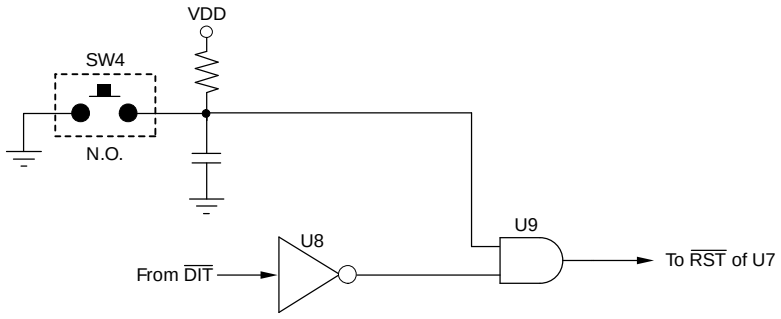

Figure 3. Transmitter Reset Circuitry

4 Schematic, PCB Layout, and Bill of Materials

This section provides the electrical schematic and physical layout information for the PCM4201EVM. The bill of materials (BOM) is included as a component reference.

Note:
Board layouts are not to scale. These figures are intended to show how the board is laid out; they are not intended to be used for manufacturing PCM4201EVM PCBs.

4.1 Schematic

The electrical schematic for the PCM4201EVM is shown in Figure 4. The components shown in the schematic are listed in Table 10 for reference.

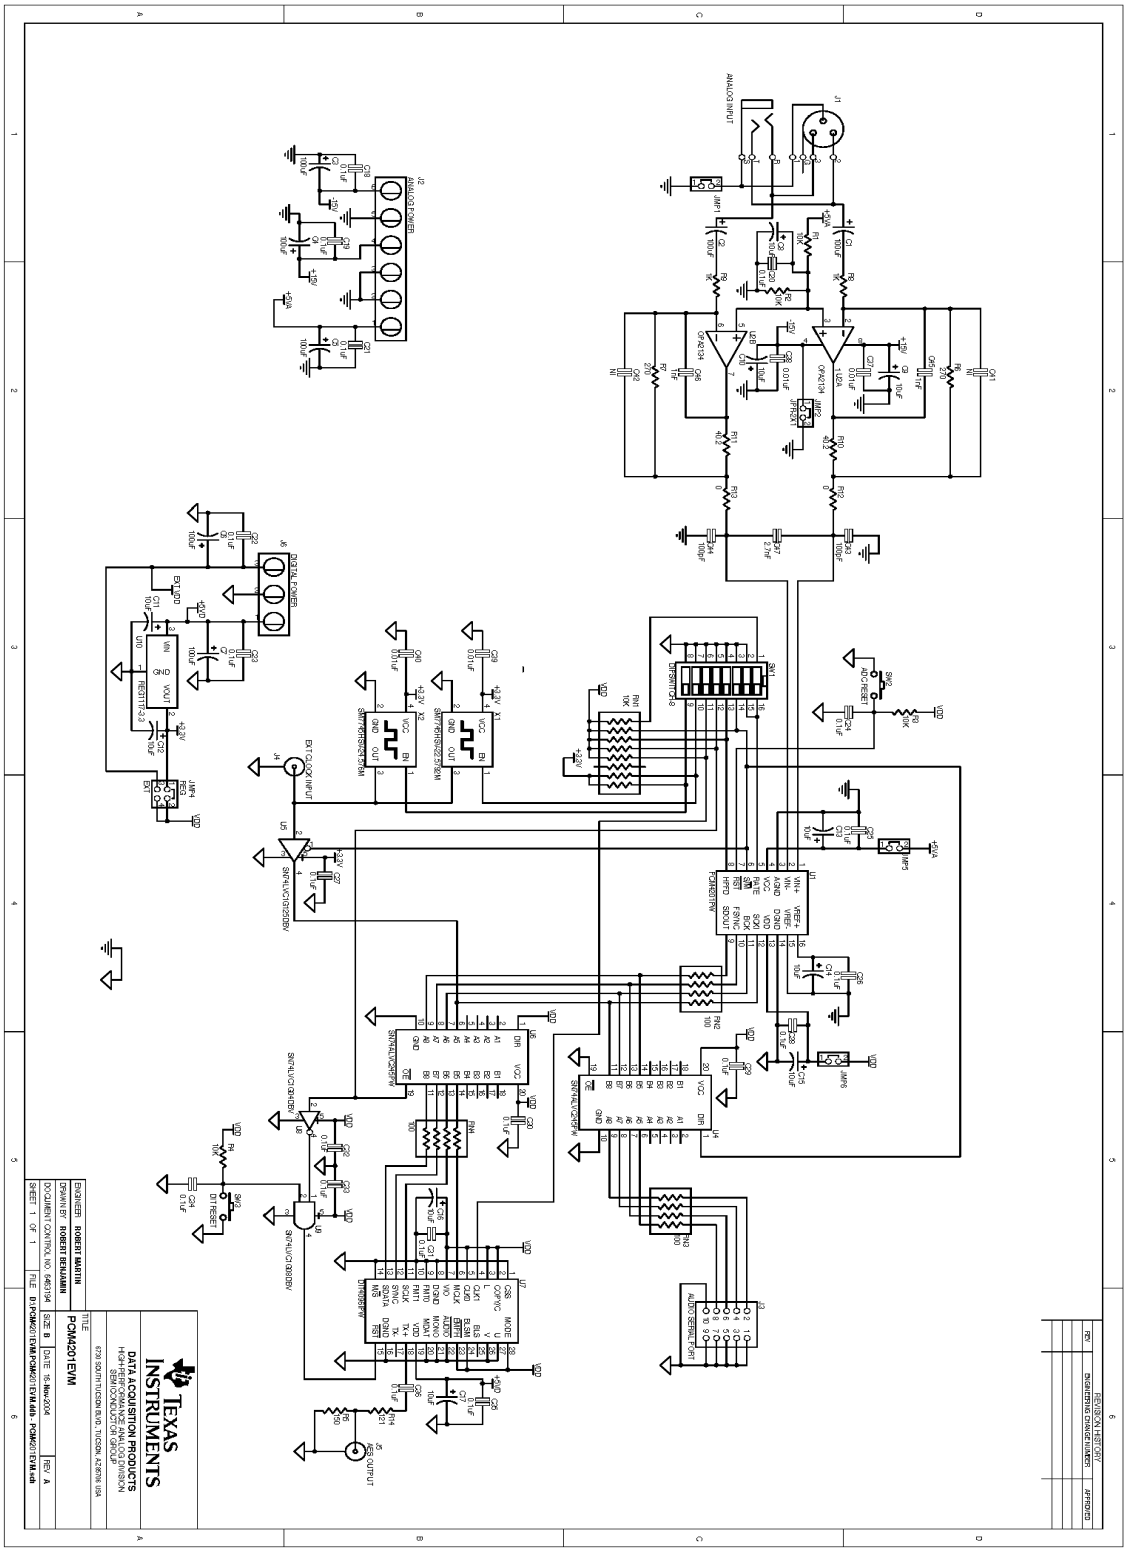

Figure 4. PCM4201EVM Schematic

4.2 PCB Layout

The PCB layout is a 4-layer printed circuit board (PCB) with the following layer structure:

- Layer 1: Top (component side)
- Layer 2: Ground plane
- Layer 3: Power
- Layer 4: Bottom (solder side)

Figure 5 through Figure 10 show the top and bottom side silkscreen images, along with top, ground plane, power, and bottom layers of the PCB.

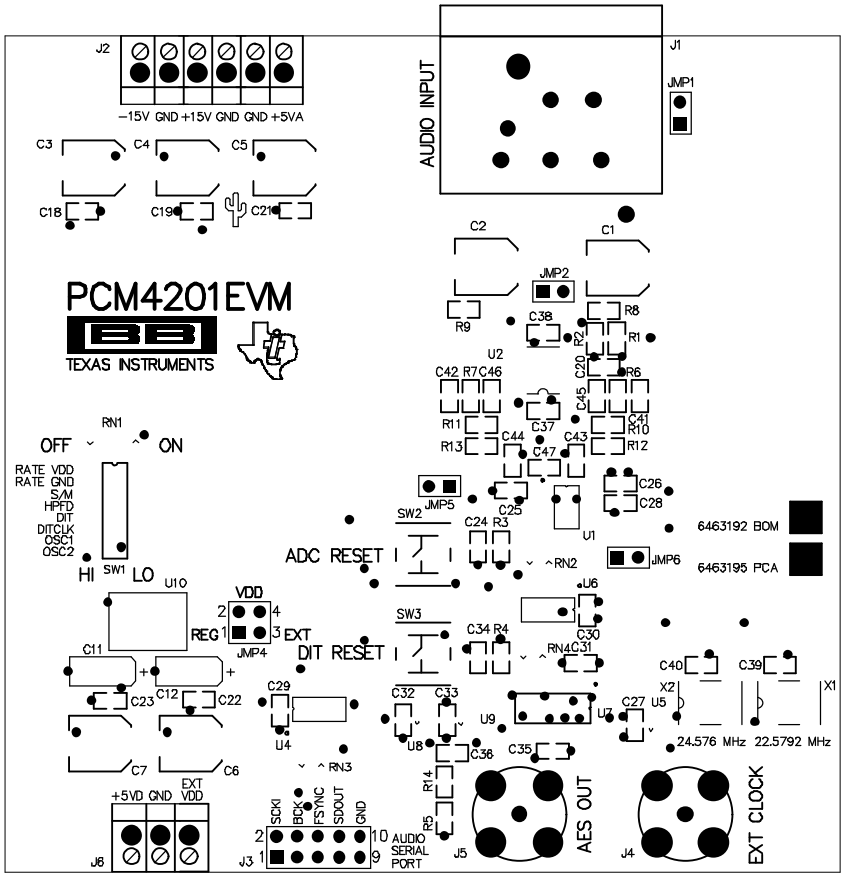

Figure 5. Top Side Silkscreen

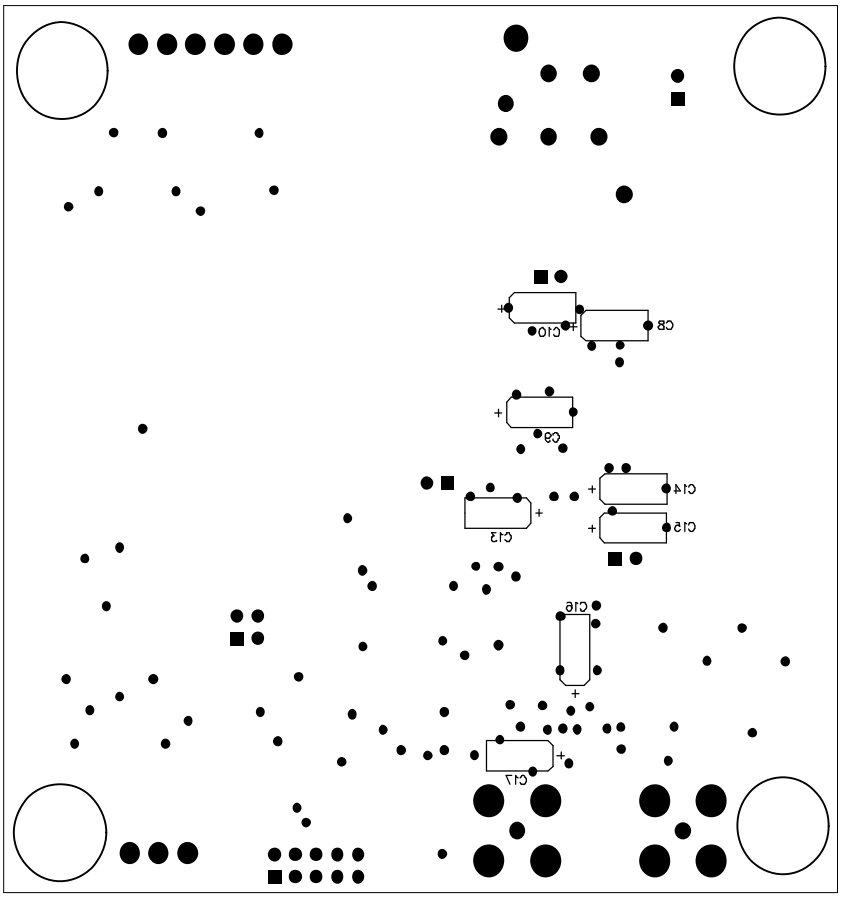

Figure 6. Bottom Side Silkscreen

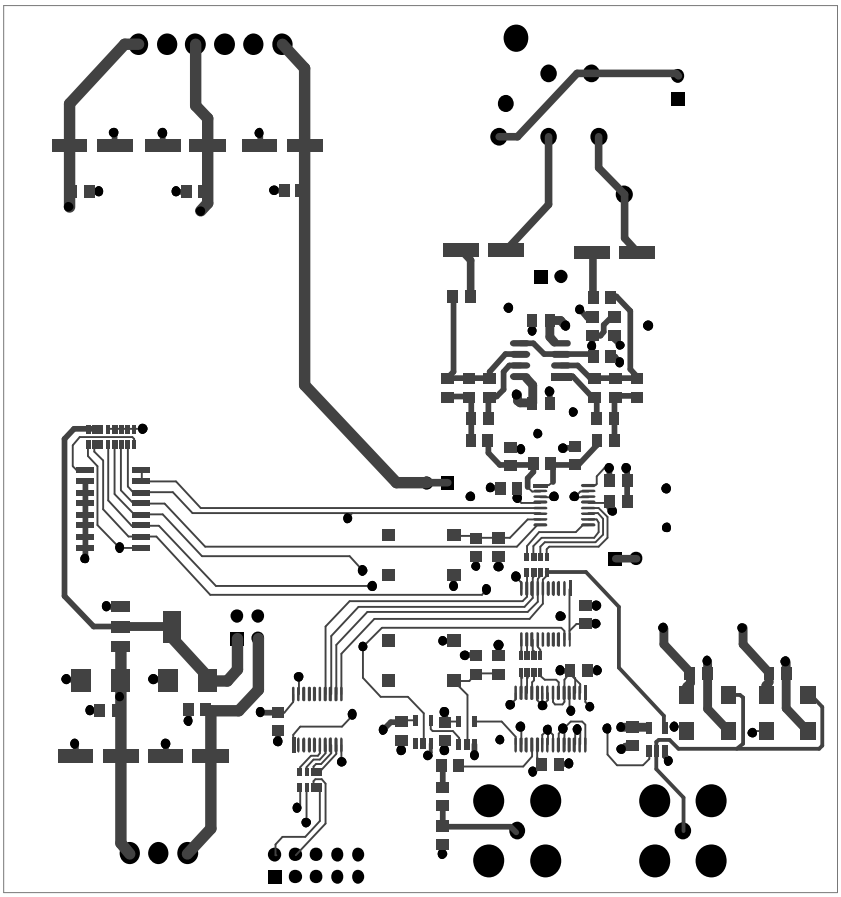

Figure 7. Top Layer (Component Side)

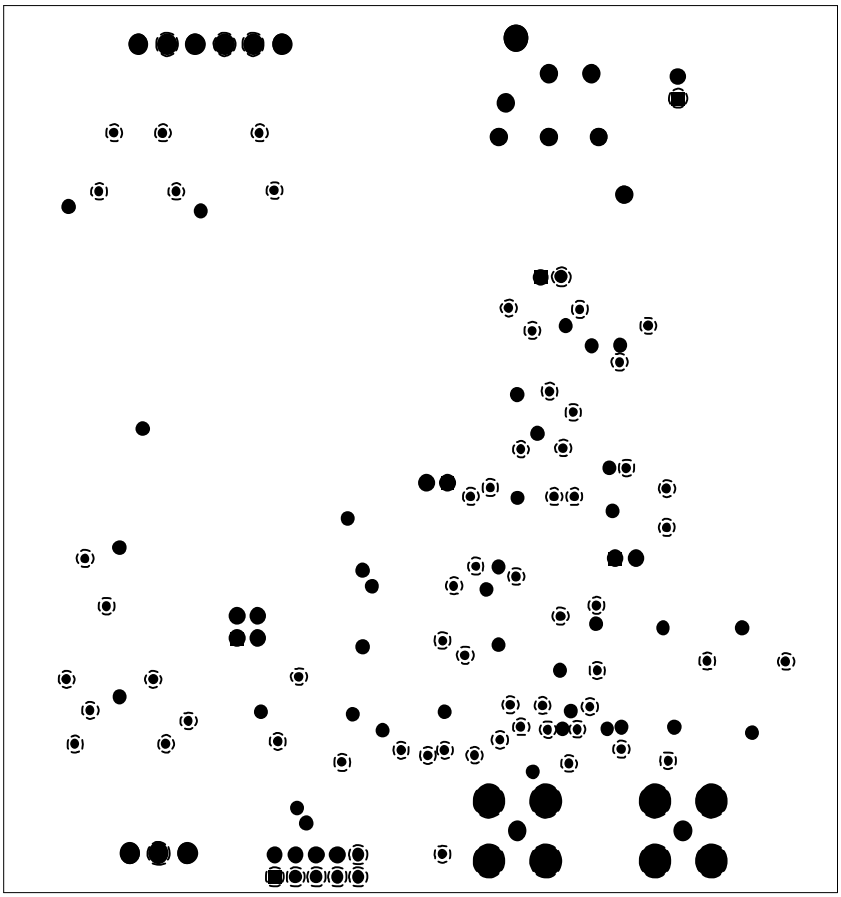

Figure 8. Ground Layer

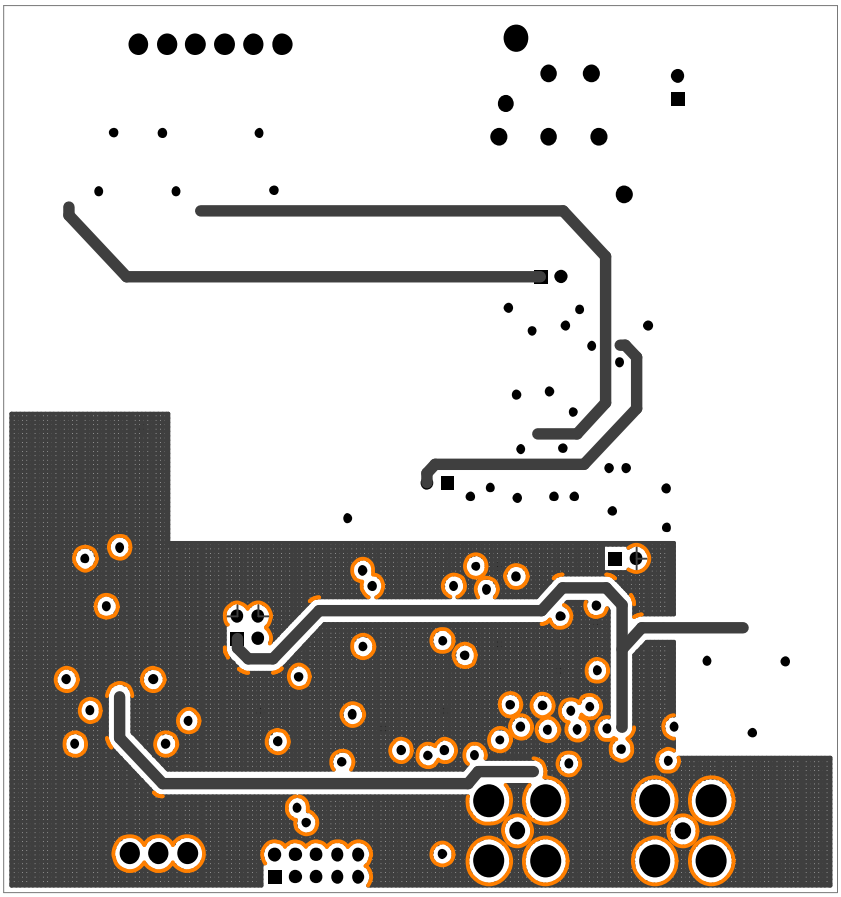

Figure 9. Power Plane Layer

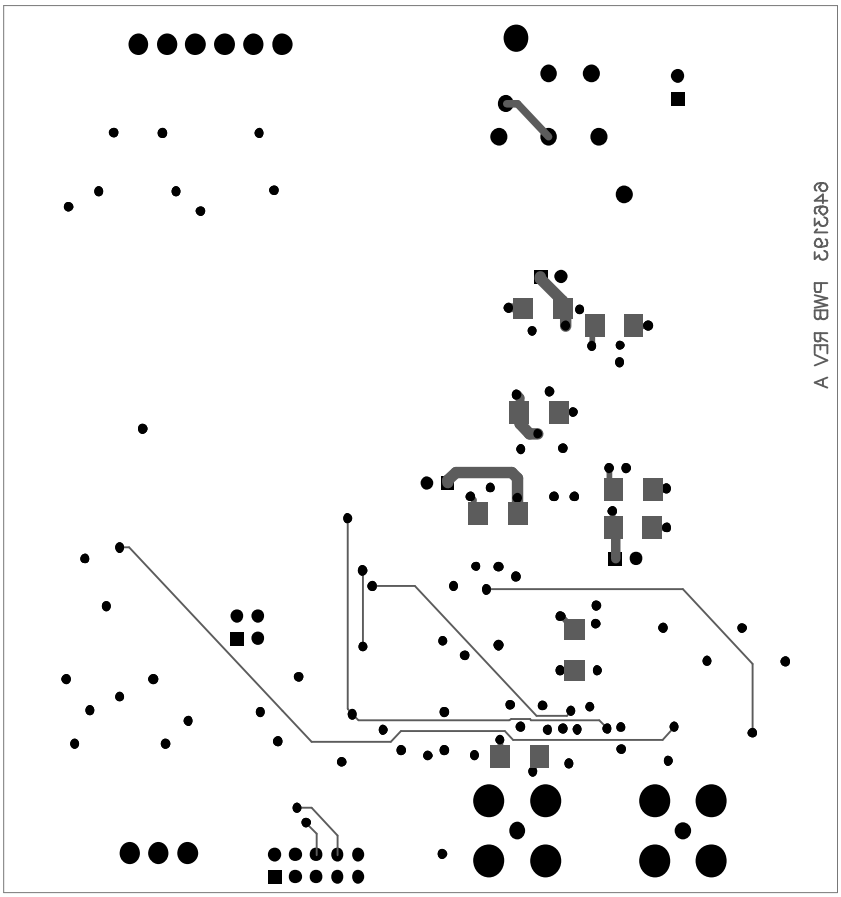

Figure 10. Bottom Layer (Solder Side)

4.3 Bill of Materials

The Bill of Materials, listing the components use in the assembly of the PCM4201EVM, is shown in Table 10.

Table 10. PCM4201EVM Bill of Materials

FCC Warnings

This equipment is intended for use in a laboratory test environment only. It generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to subpart J of part 15 of FCC rules, which are designed to provide reasonable protection against radio frequency interference. Operation of this equipment in other environments may cause interference with radio communications, in which case the user at his own expense will be required to take whatever measures may be required to correct this interference.

EVM IMPORTANT NOTICE

Texas Instruments (TI) provides the enclosed product(s) under the following conditions:

This evaluation kit being sold by TI is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not considered by TI to be fit for commercial use. As such, the goods being provided may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including product safety measures typically found in the end product incorporating the goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may not meet the technical requirements of the directive.

Should this evaluation kit not meet the specifications indicated in the EVM User's Guide, the kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user indemnifies TI from all claims arising from the handling or use of the goods. Please be aware that the products received may not be regulatory compliant or agency certified (FCC, UL, CE, etc.). Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge.

EXCEPT TO THE EXTENT OF THE INDEMNITY SET FORTH ABOVE, NEITHER PARTY SHALL BE Liable to the other FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

TI currently deals with a variety of customers for products, and therefore our arrangement with the user **is not exclusive**.

TI assumes **no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein.**

Please read the EVM User's Guide and, specifically, the EVM Warnings and Restrictions notice in the EVM User's Guide prior to handling the product. This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact the TI application engineer.

Persons handling the product must have electronics training and observe good laboratory practice standards.

No license is granted under any patent right or other intellectual property right of TI covering or relating to any machine, process, or combination in which such TI products or services might be or are used.

EVM WARNINGS AND RESTRICTIONS

It is important to operate this EVM with the operating conditions specified within Table 1 of this document.

Exceeding the specified input range may cause unexpected operation and/or irreversible damage to the EVM. If there are questions concerning the input range, please contact a TI field representative prior to connecting the input power.

Applying loads outside of the specified output range may result in unintended operation and/or possible permanent damage to the EVM. Please consult the EVM User's Guide prior to connecting any load to the EVM output. If there is uncertainty as to the load specification, please contact a TI field representative.

During normal operation, some circuit components may have case temperatures greater than 37°C. The EVM is designed to operate properly with certain components above 60°C as long as the input and output ranges are maintained. These components include but are not limited to linear regulators, switching transistors, pass transistors, and current sense resistors. These types of devices can be identified using the EVM schematic located in the EVM User's Guide. When placing measurement probes near these devices during operation, please be aware that these devices may be very warm to the touch.

Mailing Address: Texas Instruments, Post Office Box 655303, Dallas, Texas 75265

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
