## 1 Introduction

### 1.1 Background

The TPS50601A-SP dc/dc converter is designed to provide up to a 6-A output in single phase operation.

The TPS50601A-SP implements split-input power rails with separate input voltage inputs for the power stage and control circuitry rated for 3 V to 6.3 V. The TPS50601A-SP provides both inputs but is designed and tested using the PVIN connected to VIN. Rated input voltage and output current range for the evaluation module are given in [Table 1](#). This evaluation module is designed to demonstrate features of TPS50601A-SP as well as provide flexibility so input, output capacitors and output inductors as well as other components such as frequency adjust, output voltage and compensations components can be modified to meet their needs when designing with the TPS50601A-SP regulator. The switching frequency is externally set at a nominal 100 kHz. TPS50601A-SP will operate with switching frequency of 100-kHz to 1-MHz range. For the EVM 100 kHz was selected as it would provide higher efficiency. The high-side and low-side MOSFETs are incorporated inside the TPS50601A-SP package along with the gate drive circuitry. The low drain-to-source on-resistance of the MOSFET allows the TPS50601A-SP to achieve high efficiencies and helps keep the junction temperature low at high output currents. The compensation components are external to the integrated circuit (IC), and an external divider allows for an adjustable output voltage. Additionally, the TPS50601A-SP provides adjustable slow start, tracking, and undervoltage lockout inputs.

**Table 1. Input Voltage and Output Current Summary of TPS50601ASPEVM**

EVM	INPUT VOLTAGE RANGE	OUTPUT CURRENT RANGE
TPS50601ASPEVM	VIN = 4.45 V to 6.3 V (VIN start voltage = 4.5 V NOM)	0 A to 6 A

### 1.2 Performance Specification Summary

A summary of the TPS50601ASPEVM performance specifications is provided in [Table 2](#). Specifications are given for an input voltage of VIN = 5 V and an output voltage of 2.5 V, unless otherwise specified. The TPS50601ASPEVM is designed and tested for VIN = 4.5 V to 6.3 V with the VIN and PVIN pins connect together with the J1 jumper. The ambient temperature is 25°C for all measurements, unless otherwise noted.

**Table 2. TPS50601ASPEVM Configuration**

SPECIFICATION	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>IN</sub> voltage range (PVIN = VIN)		4.5	5	6.3	V
V <sub>IN</sub> start voltage			4.5		V
V <sub>IN</sub> stop voltage			4.3		V
Output voltage set point			2.49		V
Output current range	V <sub>IN</sub> = 4.5 V to 6.3 V	0		6	A

### 1.3 Modifications

These evaluation modules are designed to provide access to the features of the TPS50601A-SP. Some modifications can be made to this module. Layout of EVM is designed to make it easy for customer to modify the configuration to meet their needs and adjust for different input, output capacitors, and output inductors.

#### 1.3.1 Output Voltage Set Point

The output voltage is set by the resistor divider network of R21 and R22. R21 is fixed at 10 kΩ. To change the output voltage of the EVM, it is necessary to change the value of resistor R22. Changing the value of R22 can change the output voltage above 0.804 V. The value of R22 for a specific output voltage can be calculated using [Equation 1](#).

$$R_{22} = \frac{V_{REF} \times R_{21}}{(V_{OUT} - V_{REF})}$$

where

- $V_{REF} = 0.804 \text{ V}$

(1)

**Table 3** lists the R22 values for some common output voltages. The values given in **Table 3** are standard values, not the exact value calculated using [Equation 1](#).

**Table 3. Output Voltages Available**

Output Voltage (V)	R22 Value (kΩ)
1.2	20
1.8	8.06
2.5	4.7
3.3	3.2

### 1.3.2 Maximum Duty Cycle Limit

The TPS50601A-SP can operate at high duty cycle up to 100%. As we approach 100% duty cycle, via reduction in input voltage, feedback will ensure that high side MOSFET is kept on. This will result in Vout equal to Vin less the circuit drops.

### 1.3.3 Slow-Start Time

The slow-start time can be adjusted by changing the value of C1. Use [Equation 2](#) to calculate the required value of C1 for a desired slow-start time.

$$C_1(\text{nF}) = \frac{T_{ss}(\text{ms}) \times I_{ss}(\mu\text{A})}{V_{ref}(\text{V})}$$
(2)

The EVM is set for a slow-start time of 4 ms using  $C_1 = 0.01 \mu\text{F}$  and  $I_{SS} = 2 \mu\text{A}$ .

### 1.3.4 Adjustable UVLO

The undervoltage lockout (UVLO) can be adjusted externally using R13 and R15. The EVM is set for a start voltage of 4.6 V and a stop voltage of 4.3 V using  $R_{13} = 10 \text{ k}\Omega$  and  $R_{15} = 3.4 \text{ k}\Omega$  at no load conditions. Use [Equation 3](#) and [Equation 4](#) to calculate required resistor values for different start and stop voltages. When output is loaded, this results in increase in ripple current on PVIN. In order to minimize the effect of PVIN ripple on enable, capacitor  $C_5 = 0.1 \mu\text{F}$  is installed across R15. Thus R13/C5 behaves as an RC filter.

$$R_6 = \frac{V_{START} \left( \frac{V_{ENFALLING}}{V_{ENRISING}} \right) - V_{STOP}}{I_p \left( 1 - \frac{V_{ENFALLING}}{V_{ENRISING}} \right) + I_h}$$
(3)

$$R_7 = \frac{R_1 \times V_{ENFALLING}}{V_{STOP} - V_{ENFALLING} + R_6(I_p + I_h)}$$

where

- $I_h = 3 \mu\text{A}$ ,  $I_p = 6.1 \mu\text{A}$ ,  $V_{ENRISING} = 1.14 \text{ V}$ ,  $V_{ENFALLING} = 1.11 \text{ V}$

(4)

Nominal start voltage is 4.5 V and worse case start voltage is 4.6 V. Nominal stop voltage is 4.3 V and worse case stop voltage 4 V.

## 2 Input Voltage Rails

The EVM is designed to accommodate different input voltage levels for the power stage and control logic. During normal operation, the PVIN and VIN inputs are connected together using a jumper across J1. The single input voltage is supplied at J2 (PVin+) and J5 (GND). If desired, these input voltage rails may be separated by removing the jumper across J2. Two input voltages must then be provided at both J2 (PVIN), J3 (GND) and J11 (VIN) J15 (GND).

## 3 Test Setup and Results

This section describes how to properly connect, set up, and use the TPS50601A-SP evaluation module. The section also includes test results typical for the evaluation module and covers efficiency, output voltage regulation, load transients, output ripple, input ripple, Loop Characteristics and start-up.

### 3.1 Input/Output Connections

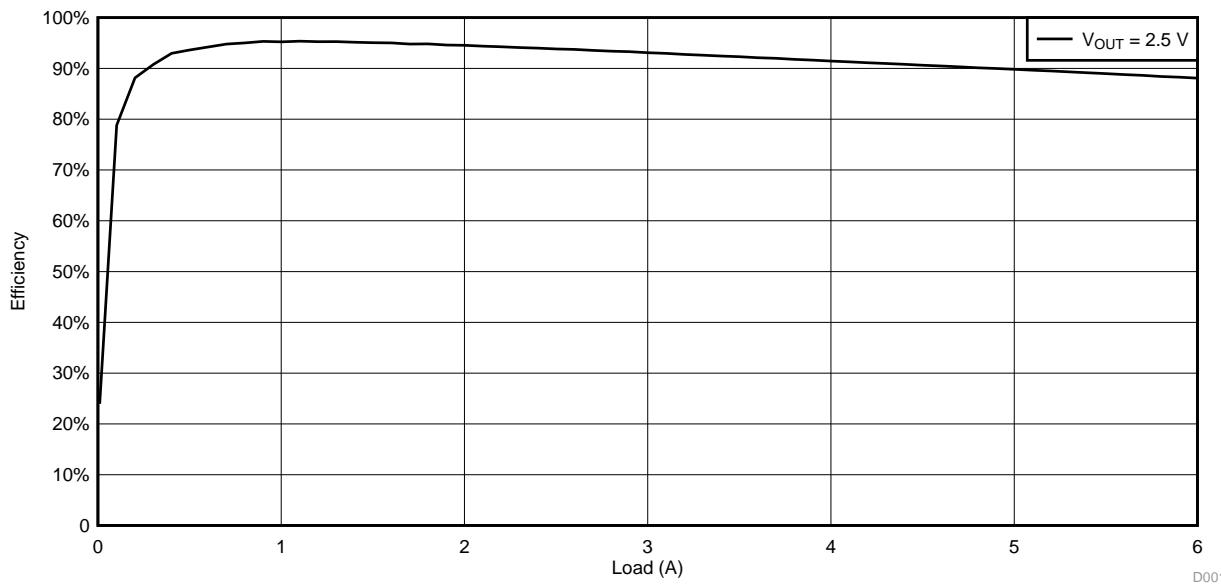

The TPS50601ASPEVM is provided with input/output connectors and test points as shown in [Table 4](#). A power supply capable of supplying 18 A must be connected to J7 through a pair of 16 AWG wires. The jumper across J1 must be in place. See [Section 2](#) for split-input voltage rail operation. The load must be connected to J8/J10 through a pair of 16-AWG wires. The maximum load current capability must be 6 A. Wire lengths must be minimized to reduce losses in the wires. Test-point TP4 provides a place to monitor the  $V_{IN}$  input voltages with TP14 providing a convenient ground reference. TP17 is used to monitor the output voltage with TP24 as the ground reference.

**Table 4. EVM Connectors and Test Points**

Reference Designator	Function
J2	PVIN input voltage banana plug (see <a href="#">Table 2</a> for PVIN range).
J5	PVIN(GND) input voltage banana plug.
J11	VIN input voltage connector. Not normally used.
J1	PVIN to VIN jumper. Normally closed to tie VIN to PVIN for common rail voltage operation.
J3	2-pin header for enable. Connect EN to ground to disable, open to enable.
J6/J7	Connecting phase 1 output to phase 2 output for Dual Operation.
J8	VOUT, 2.5 V at 6 A maximum for Single EVM.
TP6	PVIN test point at PVIN connector.
TP14	GND test point at PVIN connector.
TP4	VIN test point at VIN connector.
J4	Cold nose probe to monitor Switch/Phase node.
J9	Cold nose probe to monitor output voltage/ripple.
TP21	Output voltage test point at VOUT connector.
TP24	GND test point at VOUT connector.
TP3	PWRGD test point.

### 3.2 Efficiency

The efficiency of this EVM peaks at a load current of about 1 A and then decreases as the load current increases towards full load. [Figure 1](#) shows the efficiency for the TPS50601ASPEVM at an ambient temperature of 25°C with  $V_{IN} = 5$  V and  $V_{OUT} = 2.5$  V. Peak efficiency at 1 A is 95%.

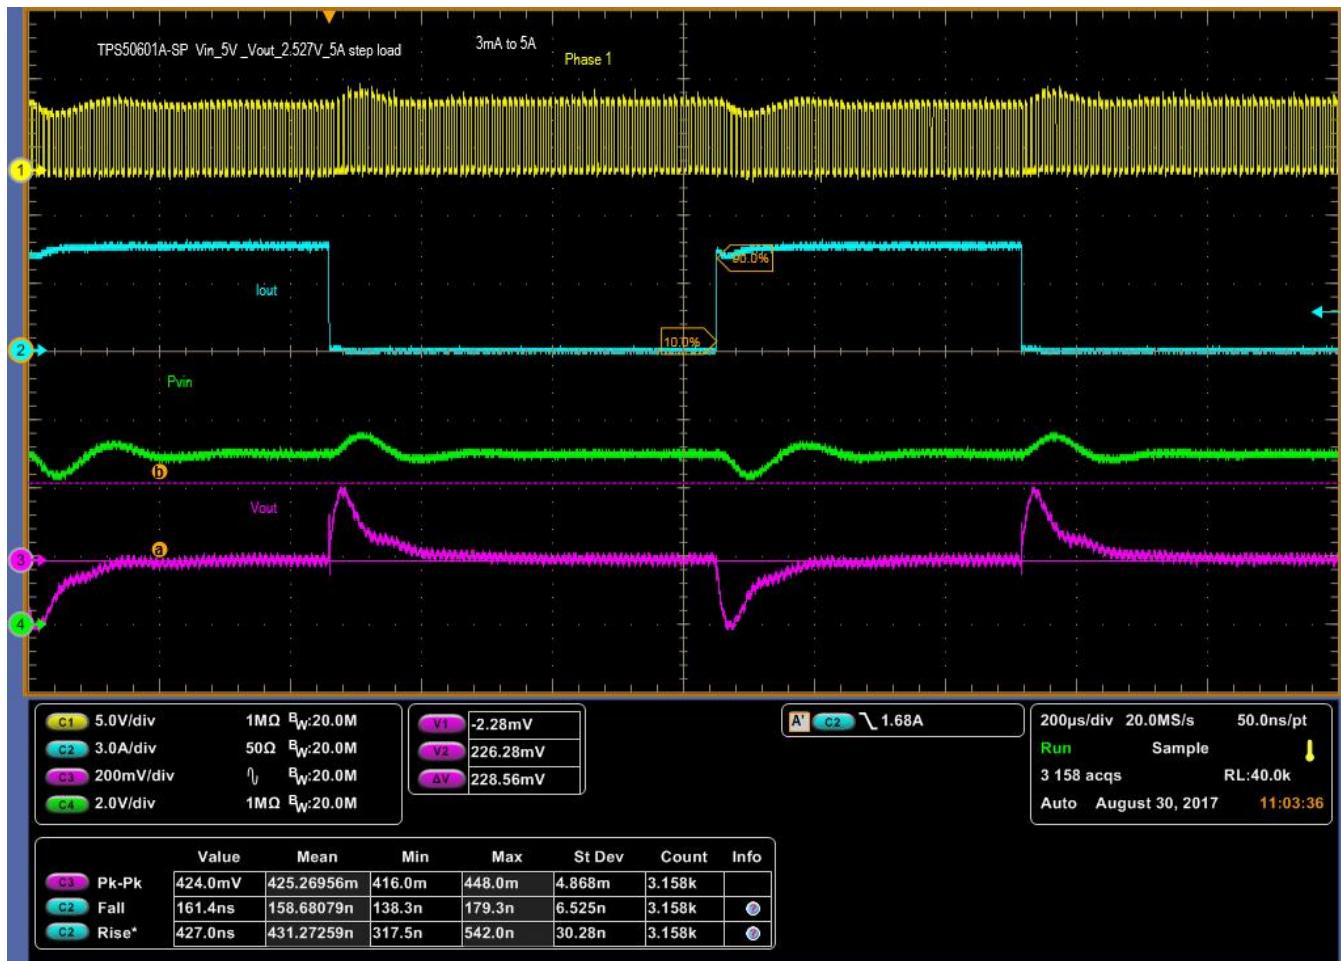

**Figure 1. TPS50601ASPEVM Efficiency**

The efficiency may be lower at higher ambient temperatures, due to temperature variation in the drain-to-source resistance of the internal MOSFET.

### 3.3 Load Transients

Figure 2 shows the TPS50601ASPEVM response to load transients. The current step is from 3 mA to 5 A of maximum rated load at 5-V input. Total peak-to-peak voltage variation is as shown, including ripple and noise on the output.

Ch1 = Phase node

Ch2 = Output load

Ch3 = Vout

Ch 4 = Pvin

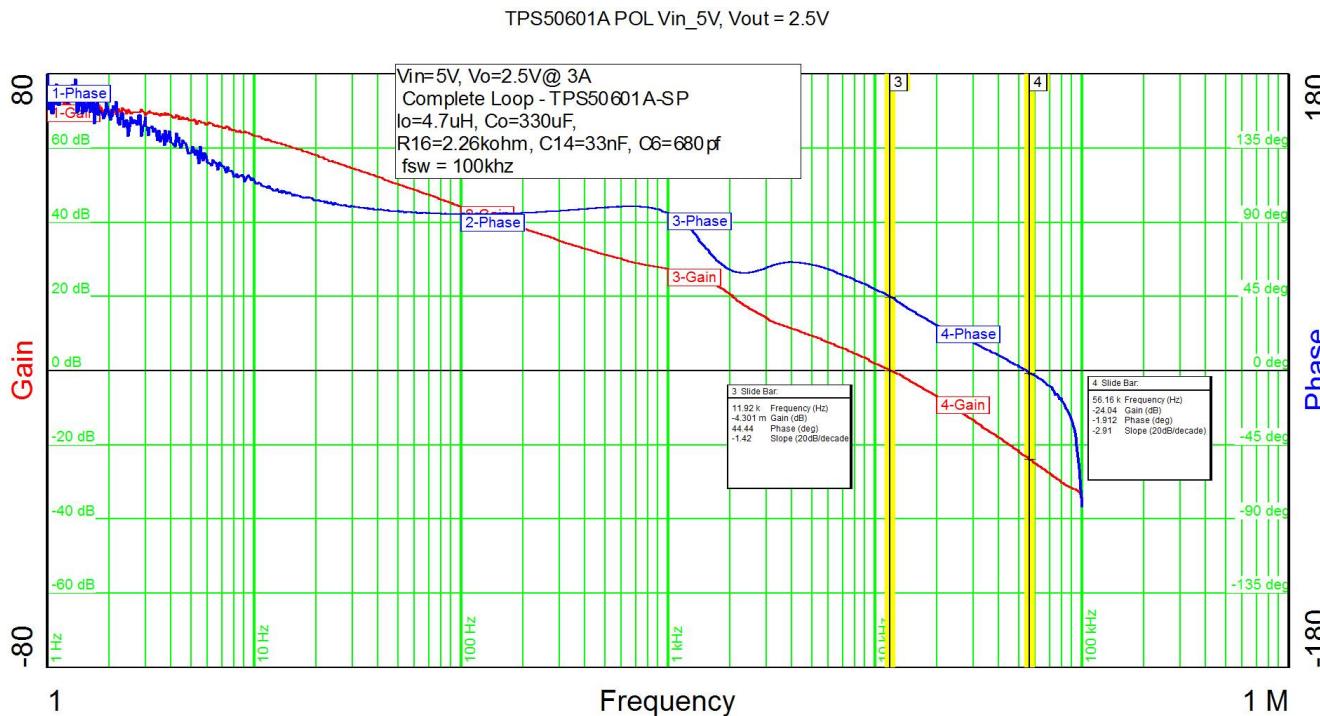

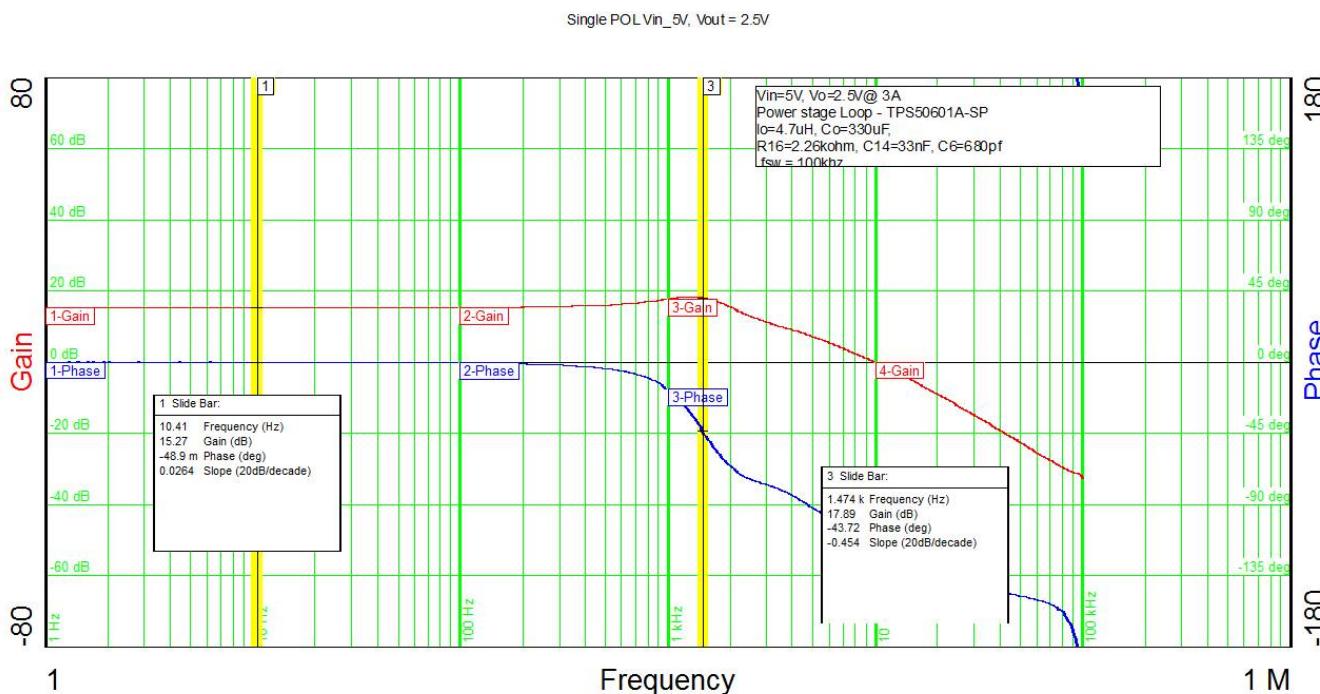

Figure 2. TPS50601ASPEVM Transient Response

### 3.4 Loop Characteristics

Figure 3 shows the TPS50601ASPEVM loop-response characteristics. Gain and phase plots are shown for VIN voltage of 5 V. Load current for the measurement is 3 A.

Output inductor is selected per [Equation 5](#) where Kind is 0.45 for this application that results in output inductor value of 4.7  $\mu$ H with pk-pk inductor current of 2.7 A. Output capacitor is 330  $\mu$ F with 5-m $\Omega$  ESR. Compensation components as follows: R16 = 2.26 k $\Omega$ , C14 = 33 nF, C8 = 680 pf.

$$L1 = \frac{V_{INMAX} - V_{OUT}}{(I_O - Kind)} \times \frac{V_{OUT}}{V_{INMAX} \times f_{SW}} \quad (5)$$

**VIN = 5 V**
**VOUT = 2.5 V @ 3 A**
**Figure 3. TPS50601ASPEVM Complete Loop Response**

**Figure 4. TPS50601ASPEVM Power Stage**

### 3.5 Output Voltage Ripple

Figure 5 shows the TPS50601ASPEVM output voltage ripple. The output current is the rated full load of 6 A and VIN = 5 V. The ripple voltage is measured at J9 with oscilloscope bandwidth limited to 20 MHz. Note C20 0.1 $\mu$ F capacitor is installed close to J9 to help suppress high-frequency noise.

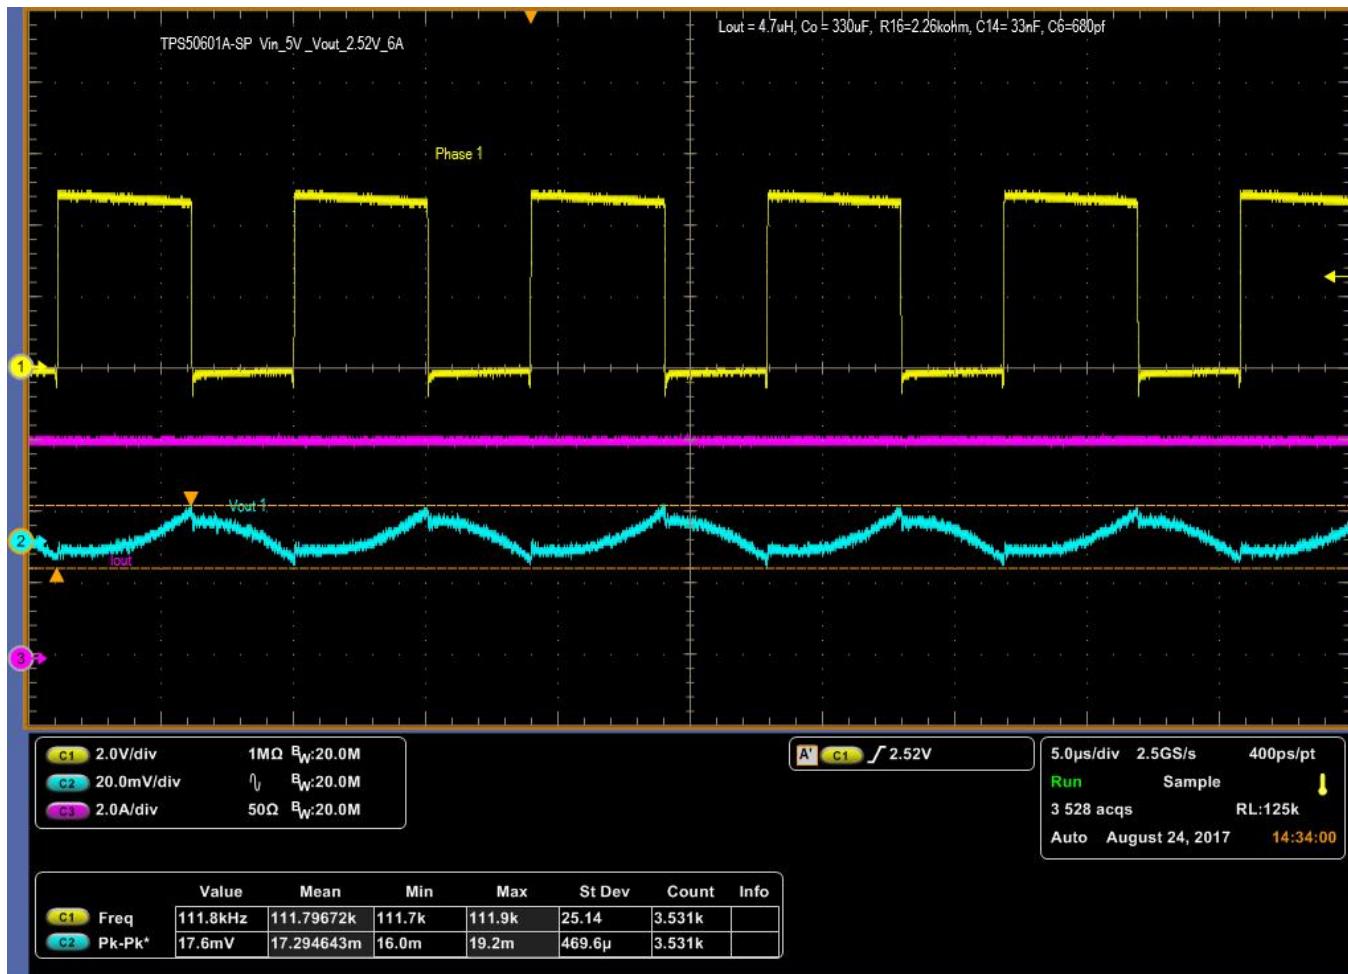

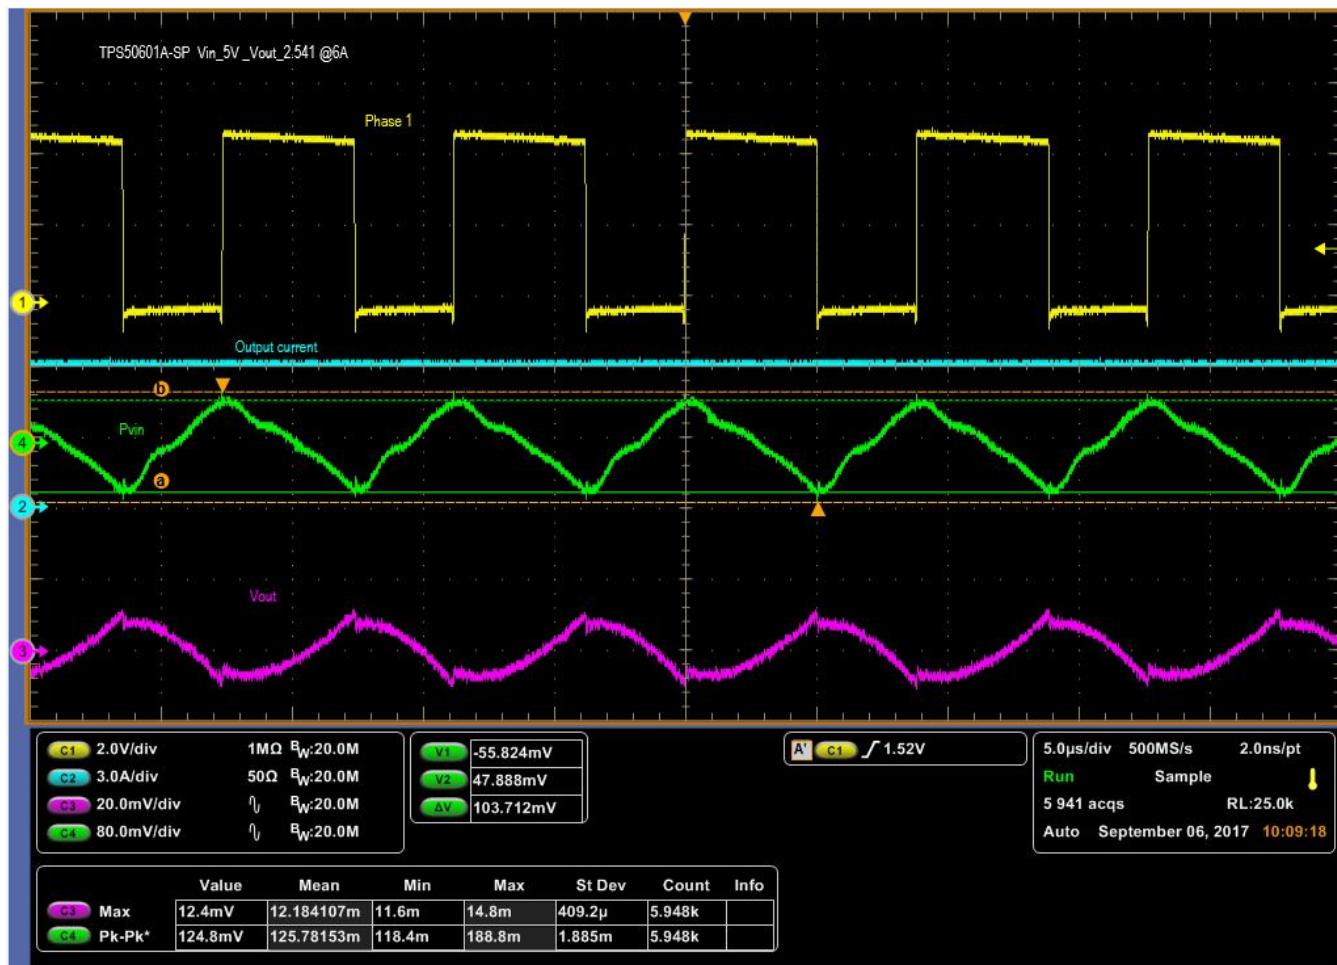

Figure 5. TPS50601ASPEVM Output Ripple

### 3.6 Input Voltage Ripple

Figure 6 shows the TPS50601ASPEVM input voltage. The output current is the rated full load of 6 A and VIN = 5 V. The ripple voltage is measured directly across the input capacitors. Ch 3 highlights output ripple, whereas Ch 4 highlights Pvin ripple.

**Figure 6. TPS50601ASPEVM Input Ripple**

### 3.7 Powering Up

Figure 7 and Figure 8 show the start-up waveforms for the TPS50601ASPEVM. In Figure 7, the output voltage ramps up as soon as the input voltage reaches the UVLO threshold as set by the R13 and R15 resistor divider network. In Figure 8, the input voltage is initially applied and the output is inhibited by using a jumper at J3 to tie EN to GND. When the jumper is removed, EN is released. When the EN voltage reaches the enable-threshold voltage, the start-up sequence begins and the output voltage ramps up to the externally set value of 2.5 V. The input voltage for these plots is 5 V and the load is 6 A.

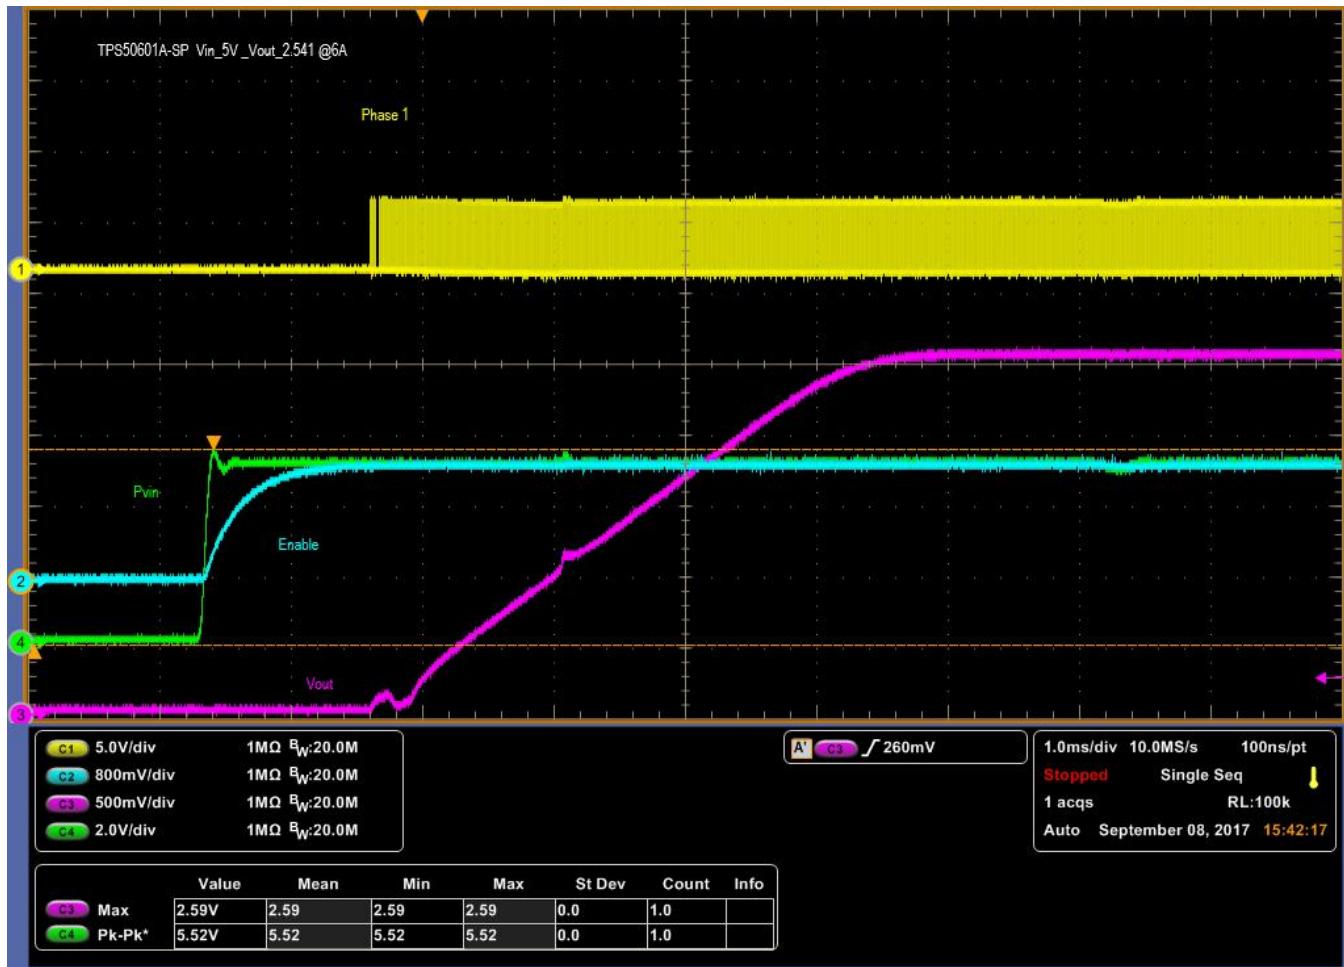

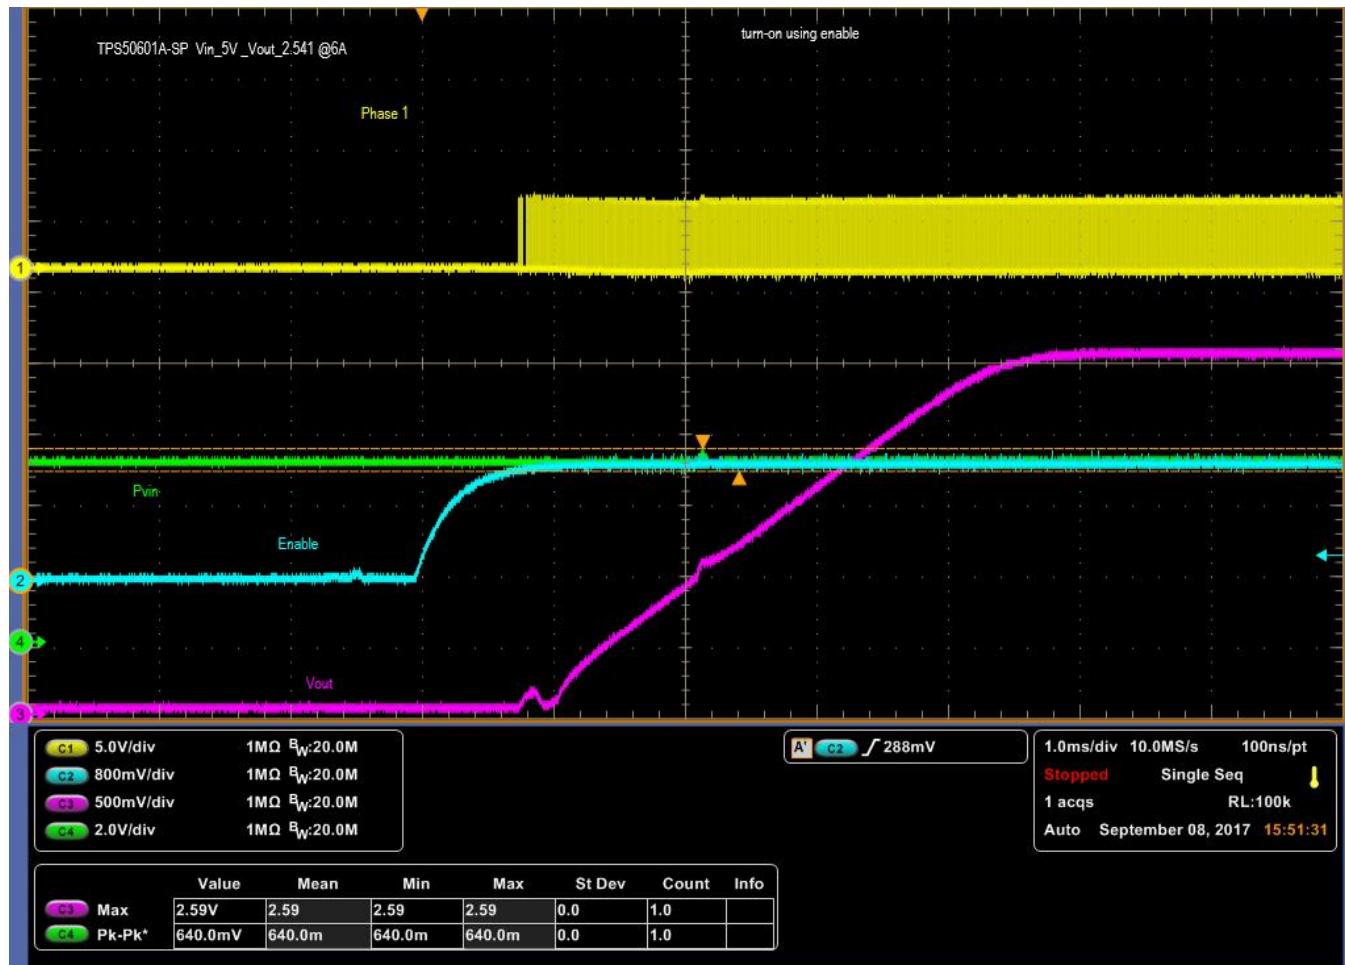

Figure 7. TPS50601ASPEVM Start-Up Relative to  $V_{in}$

**Figure 8. TPS50601ASPEVM Start-up Relative to Enable**

## 4 Board Layout

This section provides a description of the TPS50601ASPEVM, board layout, and layer illustrations.

### 4.1 Layout

The board layout for the TPS50601ASPEVM is shown in [Figure 9](#) through [Figure 13](#). The top-side layer of the EVM is laid out in a manner typical of a user application. The top, bottom, and internal layers are 2-oz copper.

The top layer contains the main power traces for PVIN, VIN, VOUT, and VPHASE. On the top layer are power and ground connections of the TPS50601ASPEVM. TPS50601A-SP IC is mounted on the top layer with thermal pad and pin 1 (analog ground) of TPS50601A-SP connected to the second layer, the ground plane. The third layer has signal traces. The top side ground traces are connected to the bottom and internal ground planes with multiple vias placed around the board. Vias directly under the TPS50601A-SP device provide a thermal path from the top-side ground plane to the bottom-side ground plane and connecting to layer 3 (analog ground).

The input decoupling capacitors (C8, C9, C10, C11, C12, C3, C4) are all located as close to the IC as possible. In addition, the voltage set-point resistor divider components are also kept close to the IC. The voltage divider network ties to the output voltage at the point of regulation. Hooks are placed allowing the user to run bode plots on the unit by replacing R19 with a 50- $\Omega$  resistor. For the TPS50601ASPEVM, an additional input bulk capacitor may be required, depending on the EVM connection to the input supply. Critical analog circuits such as the voltage set point divider, frequency set resistor, slow start capacitor and compensation components are terminated to analog ground using a wide ground trace separate from the power ground pour. Analog ground is connected to power ground.

TPS50601ASPEVM PCB is made larger than required to provide flexibility for the customer to add additional capacitors on both input and output as well as replace output inductors to meet their system needs.

## **IMPORTANT NOTICE AND DISCLAIMER**

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale ([www.ti.com/legal/termsofsale.html](http://www.ti.com/legal/termsofsale.html)) or other applicable terms available either on [ti.com](http://ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.
